Weekly Python Challenge 25

Create a function yell which accepts a single string argument. It should return(not print) an uppercased version of the string with an exclamation point added at the end. For example:

```
In [1]: def yell(s):
            return s.upper()+'!'
```

```
In [2]: yell("go away")
```

```
Out[2]: 'GO AWAY!'
```

```
In [3]: yell("leave me alone")
```

```
Out[3]: 'LEAVE ME ALONE!'
```
